1. Performance Checks

[1] PERFORMANCE CHECKS

The CS70M should be checked and, if necessary, readjusted after repairs to ensure that it is operating properly. In addition, portions of the synthesizer may require readjustment if components are replaced or other electrical repairs are made. This procedure provides instructions for checking the performance of this CS70M against the specifications.

The following preliminary procedure ensures that the instrument malfunction is not caused by improper control settings, and helps determine where to begin on the trouble-shooting chart.

Incorrect control settings can indicate a trouble that does not exist. If there are any questions concerning correct function or operating of any control, see the operating descriptions of the SERVICE GUIDE.

[2] TROUBLESHOOTING TECHNIQUES

This trouble-shooting procedure is arranged in an order which checks the simple trouble possibilities before proceeding with extensive trouble-shooting. The first few checks ensure proper waveshape operation. If the trouble is not located by these checks, the remaining steps aid in locating the defective component.

To locate the source of a malfunction in instrument operation, the trouble symptom will often indicate the identity of the faulty circuit(s).

If the trouble symptom does not indicate which circuit is causing problems, a more systematic troubleshooting procedure is necessary. OVERALL QUICK REFERENCE TROUBLESHOOTING provides a general guide for locating the circuits which are most likely causing the instrument to malfunction.

NOTE:

Voltages and waveforms given on the diagrams are not absolute and may vary slightly between instruments.

Panel layout

1. Performance Checks

(3) PANEL SETTINGS

The following preliminary procedure ensures that the instrument malfunction is not caused by improper control setting and helps determine where to begin on troubleshooting chart:

BLOCK	FUNCTION	POSITION
OUTPUT	ON/OFF VOLUME	ON 10
PITCH	TUNE DETUNE	CENTER CENTER
CHORUS	SPEED TREMOLO ENSEMBLE	OFF OFF OFF
MODE	NORMAL/SPLIT/UNISON 2/4 / 4/2	NORMAL 2/4
LFO	~ / \ / □ SPEED WHEEL/FOOT CONT. AFTER TOUCH SENSITIVITY	~ CENTER BOTH OFF OFF Fully turn to right
POLYPHONIC SEQUENCER	TEMPO OTHER SWITCHES	CENTER OFF
PROGRAMM- ABLE VCO PARAMETERS	VCO	ON

1. Performance Checks

[4] DIGITAL QUICK CHECK POINTS(CPU)

Refer to overall Troubleshooting diagrams to determine which circuit part of the CPU circuit board is malfunctioning.

CPU CIRCUIT

① CLOCK ϕ

Check for IC No. 28, pin 6 on CPU circuit board.

The clock waveform is outlined in Figure 1 below.

② $\overline{\text{NMI}}$

Check for IC No. 28, pin 17 on CPU circuit board.

A symmetrical square wave signal of 1.67 ± 0.02 msec cycle period is obtained at pin 17 of IC28.

③ $\overline{\text{INT}}$

Check for IC No. 29, pin 11 on CPU circuit board.

A symmetrical square wave signal of 13.3 ± 0.2 msec cycle period is obtained at pin 11 of IC29.

④ The CPU of the Z80 address map is provided below for reference purpose.

Note, however, that since A14 and A15 are not decoded in this model address 400-FFFF involve repetition of addresses 0000-3FFF.

Memory Address Map

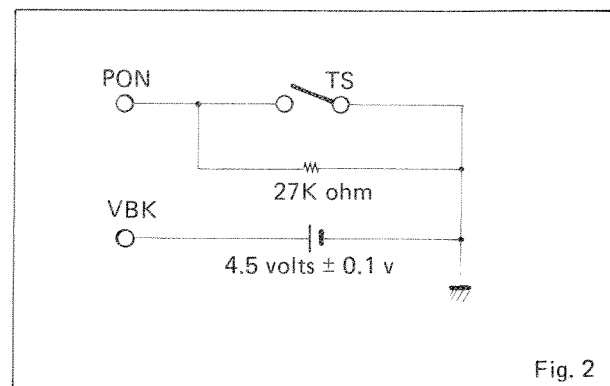

Address No.	ROM/RAM
0000 – 07FF	ROM IC 49
0800 – 0FFF	ROM IC 50
1000 – 17FF	ROM IC 51
1800 – 2BFF	Free
2000 – 2FFF (Timbre memory)	RAM IC 68, 69
3000 – 33FF (SEQUENCER)	RAM IC 66, 67
3400 – 37FF (SEQUENCER)(I/O)	RAM IC 70, 71
3800 – 3BFF (SEQUENCER)	RAM IC 64, 65
3000 – 3FFF (SEQUENCER)	RAM IC 62, 63

⑤ INITIAL CLEAR AND RAM BACK UP CIRCUITS

Check for memory back up and initial clear circuits.

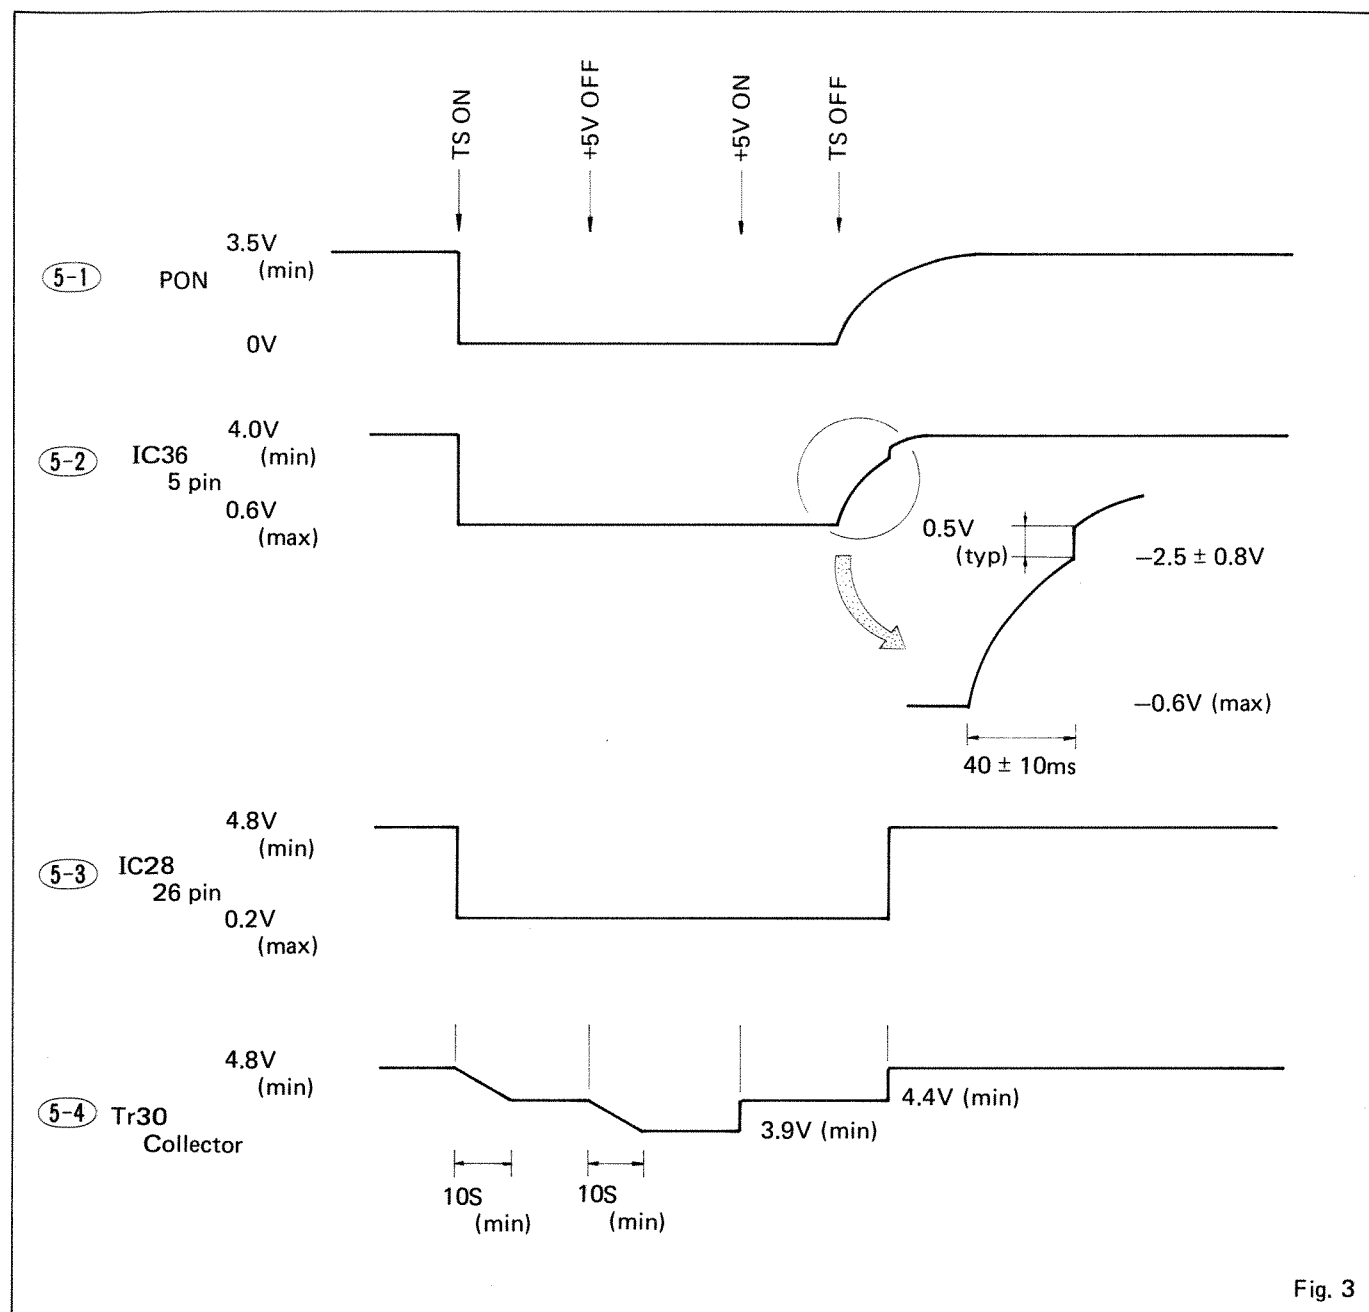

Waveforms as provided in Figure 3. Should be obtained when +5 volts and TS is set to ON or OFF.

Circuit diagram as shown in Figure 2 should be provided for initial clear and RAM Back up circuits purpose only.

*See CS70M OVERALL CIRCUIT DIAGRAM FOR TROUBLESHOOTING.

1. Performance Checks

** See CS70M OVERALL CIRCUIT DIAGRAM FOR TROUBLESHOOTING.*

1. Performance Checks

⑥ CARD READER INTERFACE

The I/O address map for the card reader is outlined below.

Address	I/O	PORT
70	out	Data control (IC52)
12	in	Data switch (2/2 IC45)
13	in	Flag (2/2 IC45)

⑥-1 DATA CONTROL OUTPUT CHECK

Check for IC No. 52 pins 2, 7 and 10 on CPU circuit board.

When data is written into IC52, the contents of data bits 0 ~ 2 are inverted and obtained at MCS, MRS and RWC. And when bit (10 pin) is 0, a symmetrical square wave signal with a 1.67 msec cycle appears at the WDT terminal.

When this bit is 1, however, the cycle time is halved.

⑥-2 DATA SWITCH INPUT CHECK

Check for IC No. 45 1/2 pins 4, 6 and 10 on CPU circuit board.

When data switch input reads I/O address No. 12 (IC 45 1/2), the WPS, MADS and CLS pin status (H or L) is obtained by data bits 0 ~ 2 (IC No. 45 1/2 pins 4, 6 and 10).

And if a suitable pulse is applied to DCP terminal, the DDP status will be latched by that pulse, inverted, and be obtained at IC45 1/2 pin 4 of I/O address 12.

⑥-3 FLAG CHECK

Check for IC No. 45 2/2 and 46 1/2 pin 11.

The output data accepted flag (IC 33 1/2 is set by the leading edge of ACP, and reset by writing in CPU I/O address No. 70 IC No. 52, the status appearing in bit 7 of I/O address No. 13 IC 45 2/2, pin 11. The input data ready flag (IC 46 1/2 is set by the leading edge of the pulse applied to DCP and reset by reading CPU I/O address 12 IC 45 1/2, the status appearing in bit 6 of I/O address 13 IC 45 2/2.

⑦ LED DRIVER CIRCUIT CHECK

The I/O address map for control panel LEDs is shown in the following table.

I/O Address Map		
Address	in/out	PORT
50	out	LED anode driver (IC57)
60	out	LED cathode driver (IC56)

⑦-1 The contents of bits 0 ~ 2 (D0 ~ D2 IC57) of the data written in address No. 50 of IC57 are decoded by IC60 and obtained in negative logic at CM0 ~ CM7. The data written in address No. 60 of IC56, on the other hand, is obtained at LE0 ~ LE7.

⑦-2 Waveforms as shown in Figure 4 should be obtained.

Time chart and waveforms

Fig. 4

*See CS70M OVERALL CIRCUIT DIAGRAM FOR TROUBLESHOOTING.

1. Performance Checks

⑧ PANEL SWITCH CIRCUIT CHECK

The I/O address map for panel control switches is shown in the following table.

Panel Switch I/O Address Map

Address	in/out	PORT
30	out	Panel switch address (IC58)
40	out	Panel switch strobe (IC59)
10	in	Panel switch data (IC47)

- ⑧-1 The bit 0 ~ bit 3 (D0 ~ D3) contents of the data written in I/O port address No. 30 (IC58) is obtained at the PAA ~ PAD terminals, while the bit 0 ~ bit 2 contents (D0 ~ D2) of the data written in I/O port address No. 40 (IC59) is obtained at the IS1 ~ IS3 terminals.

- ⑧-2 And when I/O port address No. 10 (IC47) is read, the PD0 ~ PD5 terminal status is obtained in bit 0 ~ bit 5 (IC47 outputs).

⑨ KEYBOARD DATA CIRCUIT CHECK

IC No. 42 outputs, pins 3, 5, 7, 9, 11 and 13 on CPU circuit board.

IC No. 43 1/2 outputs, pins 3, 5, 7 and 9.

- ⑨-1 When CPU reads I/O address No.00 ~ 09 (IC42, IC43 1/2), waveforms as shown in Figure 5 should be obtained at the KBD0 ~ KBD9 terminals. And C# ~ F# and CL terminal status are obtained in bit 0 ~ bit 6 at output terminals of IC42 and IC43 2/2.

*See CS70M OVERALL CIRCUIT DIAGRAM FOR TROUBLESHOOTING.

1. Performance Checks

[5] FUNCTIONS

Note:

1. All settings should be made as shown in item [3] panel settings unless specified.
2. When performing any checks, depress the A4 unless otherwise specified.
3. The MIX/1 jack on the rear panel is used as a monitor terminal.
4. Each key should be depressed six times for monitoring of each item, and see if the procedure is correct for each key depression.

The same procedure should be made from item A. through C. for both I and II controls. At that time, however, I-II BALANCE should be set to I when I controls are monitored, and set to II when II controls are monitored.

A. PROGRAMMABLE PARAMETERS VCO section

1. Waveforms as shown in Figure 1 should be obtained when the key is depressed.

2. Waveforms as shown in Figure 2 should be obtained when \searrow and \sqcap are set to OFF and ON, respectively.

3. Waveforms should vary as shown in Figure 3 when PW is shifted up to 90% under a condition as described in item A-2.

1. Performance Checks

4. Waveforms as illustrated in Figure 4 should be obtained when Γ and NOISE are set to OFF and 10 respectively, with controls set to each specified position in item A-3.

B. PROGRAMMABLE PARAMETERS VCF section

1. Set RESONANCE switch to H, and bring CUTOFF FREQUENCY switch down to a position where the waveform shown in Figure 5 is obtained. At that time, however, the waveforms given in Figures 6 and 7 are obtained when Hp and Bp are set to ON, respectively.

After this, BP is switched to OFF, then EG DEPTH is set to 10, and the waveform shown in Figure 8 is obtained.

2. Set ATTACK TIME and SUSTAIN LEVEL switches to L and O respectively, with controls set to each specified position in item B-1. Then, waveforms illustrated in Figure 5 should be obtained immediately after the key is depressed, and becomes what is given in Figure 9 in 1 ± 0.1 second. After that, the waveform instantaneously returns to its initial form, which is shown in Figure 5.

1. Performance Checks

3. When the previous-mentioned procedure B-2 is finished, set ATTACK TIME and DECAY TIME switches to S and L, respectively, so that waveforms provided in Figure 10 should be obtained when the key is depressed. In addition, waveforms given in Figure 5 should be obtained in 10 ± 2 seconds with a level of more than 90%.
4. Set the following control in such an order as: DECAY TIME, S; SUSTAIN LEVEL, 10; RELEASE TIME, L; VCA section TIME $\times 5$, ON; and RELEASE, L, with controls set to each specified position in item B-3. After that, waveforms provided in Figure 8 should be obtained when the key is depressed, while waveforms given in Figure 5 should be obtained in 10 ± 2 seconds with a level of more than 90%, when the key is released.
5. Set TIME $\times 5$ to ON with controls set to each specified position in item B-2. At that time, waveforms shown in Figure 5 should be obtained when the key is depressed. Waveform should become as in Figure 9 in 6 ± 1 seconds and turn back to that in Figure 5 immediately.
6. Set \checkmark to On with controls set to each specified position in item B-1. At that time, waveforms as given in Figure 11 should be obtained. There is a click-noise immediately after the key is depressed.

C. PROGRAMMABLE PARAMETERS VCA section

1. Set \backslash of the VCO section and \sim to OFF and 10, respectively. At that time, waveforms as illustrated in Figure 12 should be obtained.

1. Performance Checks

2. Set ATTACK TIME and SUSTAIN LEVEL switches to L and O respectively, with controls set to each specified position in item C-1. At that time, waveforms should vary as given in Figure 13. Further, T in Figure 13 should expand 6 ± 1 times when TIME x 5 is set to ON.

3. Set DECAY TIME and SUSTAIN LEVEL switches to L and O respectively, with controls set to each specified position in item C-1. At that time, waveforms should vary as illustrated in Figure 14.

4. Set RELEASE TIME and SUSTAIN LEVEL switches to L and O respectively, with controls set to each specified position in item C-1. At that time, waveforms should vary as given in Figure 15.

5. Set HOLD switch to ON with the key being depressed, with controls set to each specified position in item C-1. The waveforms should remain as in Figure 12 even if the key is released. Furthermore, when HOLD switch is set to OFF, the output fades out.

1. Performance Checks

D. PROGRAMMABLE PARAMETERS LFO section

1. Set SPEED and MODULATION DEPTH switches to F and 10 respectively, with controls set to each specified position in item [3] panel setting. Waveforms shown in Figure 16 should be obtained when VCA is set to ON. After that, T should be $15 \pm 4\%$ smaller when FINE is set to +, and when set to -, T should be larger than $15 \pm 4\%$.

After that, adjust the FINE switch so that T becomes 10 ± 0.2 msec. The frequency should be 0.1 ± 0.02 Hz when SPEED switch is set to S.

2. Set SPEED switch to F with controls set to each specified position in item D-1. In addition, set EG DEPTH and ATTACK TIME switches to 10 and L, respectively, so that T in Figure 16 should become 2 ± 0.4 msec, and then, 10 ± 0.2 msec in 5 ± 0.5 seconds after the key is depressed (See Figure 17). Then, set ATTACK TIME and DECAY TIME switches to S and L, respectively. After the key is depressed, T should be $2 \text{ msec} \pm 0.4 \text{ msec}$ instantaneously, then it should gradually increase.

3. Set \curvearrowright to ON with controls set to each specified position in item D-1. At that time, waveforms as provided in Figure 19 should be obtained.

(As T mentioned here denotes the reference value, no specified measurements will be required.)

(As T mentioned here denotes the reference value, no specified measurements will be required.)

1. Performance Checks

4. Set S/H to ON with controls set to each specified position in item D-3. At that time, waveforms as illustrated in Figure 20 should be obtained.

5. Set ATTACK TIME switch to L with controls set to each specified position in item D-4. Waveforms as given in Figure 21 should be obtained when GLIDE switch is set to ON.

6. Set GLIDE switch to ON with controls set to each specified position in item D-5. At that time, waveforms as provided in Figure 22 should be obtained.

7. Set VCA and VCO to OFF and ON respectively, with controls set to each specified position in item D-1. At that time, as shown in Figure 23, sound frequency should vary according to the LFO period.

1. Performance Checks

8. Set VCO and PW to OFF and ON respectively, with controls set to each specified position in item D-2. At that time, waveforms should vary as illustrated in Figure 24.

9. Set VCA and RESONANCE to OFF and H respectively, with controls set to each specified position in item D-1, and bring CUT-OFF FREQUENCY switch down to a position where a waveform indicated in Figure 5 is obtained. After that, set RESONANCE to L, waveform as shown in Figure 25 is obtained when VCF is set to ON.

11. Set MODULATION DEPTH switch to 0 with controls set to each specified position in item D-1. When WHEEL of the MODULATION section is set to ON, and turned to a maximum level, waveforms as given in Figure 26 should be obtained. In this case, waveforms as provided in Figure 1 should also be obtained when WHEEL switch is set to OFF.

12. Set RMO to ON with controls set to each specified position in item [3] panel setting. In addition, \searrow of the VCO section is switched to OFF, and \sim of the VCA section is set to 10. At that time, waveforms as shown in Figure 27 should be obtained.

1. Performance Checks

E. LFO section/MODULATION section

1. Set WHEEL-VCA (hereinafter referred to as W-VCA) and SPEED switches to ON and F respectively. Further, when MODULATION WHEEL is turned upward, waveforms as given in Figure 28 should be obtained. Likewise, when SPEED switch is set to S, T in Figure 28 should become 20 ± 4 seconds.

Fig. 28

2. Waveforms as provided in Figures 29 and 30 should be obtained when speed switch is set to the center position and $\sim/\nearrow/\sqcap$ controls set to each specified position in item E-1.

Fig. 29

Fig. 30

3. Set $\sim/\nearrow/\sqcap$ W-VCA and WHEEL-VCO (hereinafter referred to as W-VCO) to \sqcap , OFF, and ON, respectively. At that time, waveforms as shown in Figure 31 should be obtained. Set W-VCO and RESONANCE of the VCF section to OFF and H, respectively. And bring CUT OFF FREQUENCY switch down to a position where a waveform indicated in Figure 5 is obtained. After that, set RESONANCE to L.

Fig. 31

Fig. 32

1. Performance Checks

4. Set W-VCF and AFTER TOUCH-VCO (hereinafter referred to as A-VCO) to ON, with controls set to each specified position in item E-3. When the key is depressed with a pressure of approximately 500g, the sound frequency should be modulated according to the LFO period. And if further pressure is applied to the key, it should further be modulated.

VCF section close to the center position, and depress the key. At that time, modulation should be applied to VCF due to the period and waveforms of LFO according to the key depressing pressure. The same should be obtained when A-VCF and A-VCA are set to OFF and ON, respectively. (AFTER TOUCH effects are equivalent to those in MODULATION WHEEL, except for the modulation amount). In this case, however, the more the SENSITIVITY switch is turned left, the less the modulation amount, under a condition that A-VCO effects are being applied.

2. Troubleshooting

Introduction

1. **Visual check.**

Visually check the portion of the instrument in which the trouble is located. Many troubles can be located by visual indications such as unsoldered connections, broken wires, damaged circuit boards, damaged components, etc.

2. **Diagrams.**

A complete set of diagrams is given in the back of this manual. Each component in this troubleshooting is shown on the appropriate diagram, along with its circuit number and electrical value. Also included on the circuit diagrams are voltages and waveforms which can be expected at various points in the circuitry.

3. Power Switch must be turned off before removing or replacing transistors and ICs, especially.

4. The following equipment is useful for troubleshooting the model CS70M.

1. **Tester**

Some means of testing the transistors, diodes, FET's and ICs used in this instrument is very useful.

2. **Oscilloscope**

A test oscilloscope is required to view waveforms at different points in the circuit.

2. Troubleshooting

[3] TROUBLESHOOTING EXAMPLE

〈 DC POWER SUPPLY 〉

SYMPTOM	CIRCUIT BOARD	PROBABLE CAUSE
1. No voltage is put out for +5V or is insufficient. Other voltage positions operate correctly.	DC	DC Tr1—Tr2—0.22Ω·1P—D4—F3 or erroneous adjustment of VR1
2. No voltage is put out for -5V or is insufficient. Other voltage positions operate correctly.	DC	DC Tr9—Tr12—4.7Ω·230mA
3. More than +5V are put out for +5V. Other voltage positions operate correctly.	DC	DC Tr4—IC1-1/2—ZD1—D5 or erroneous adjustment of VR1
4. More than -5V are put out for -5V. Other voltage positions are operating correctly.	DC	DC Tr10—IC2-1/2
5. No voltage is put out for -15V. Other voltage positions operate correctly.	DC	DC Tr21—Tr20—0.22Ω·1P
6. More than -15V are put out for -15V. Other voltage positions operate correctly.	DC	DC Tr23—IC3-1/2
7. More than +15V and -15V are put out for each +15V or -15V. Other voltage positions operate correctly.	DC	DC Tr18—IC3-2/2—ZD4—D8 or erroneous adjustment of VR1
8. Insufficient voltages are put out for both +15V and -15V. Other voltage positions operate correctly.	DC	DC Tr16—Tr15—0.22Ω·1P or erroneous adjustment of VR1
9. No voltage is put out for -15V and insufficient voltage for +15V. Other voltage positions operate correctly.	DC	DC Tr19—Tr14—DZ3
10. No voltage is put out for -15V and insufficient voltage for other positions.	DC	DC Tr8 or Tr24
11. No voltage is put out for -15V and insufficient voltage for +15V, +10V, and -5V positions. +5V operates correctly.	DC	DC Tr5—4.7Ω·230mA
